# Data Type VS Data Structure

程序代写代做 CS 编程辅导

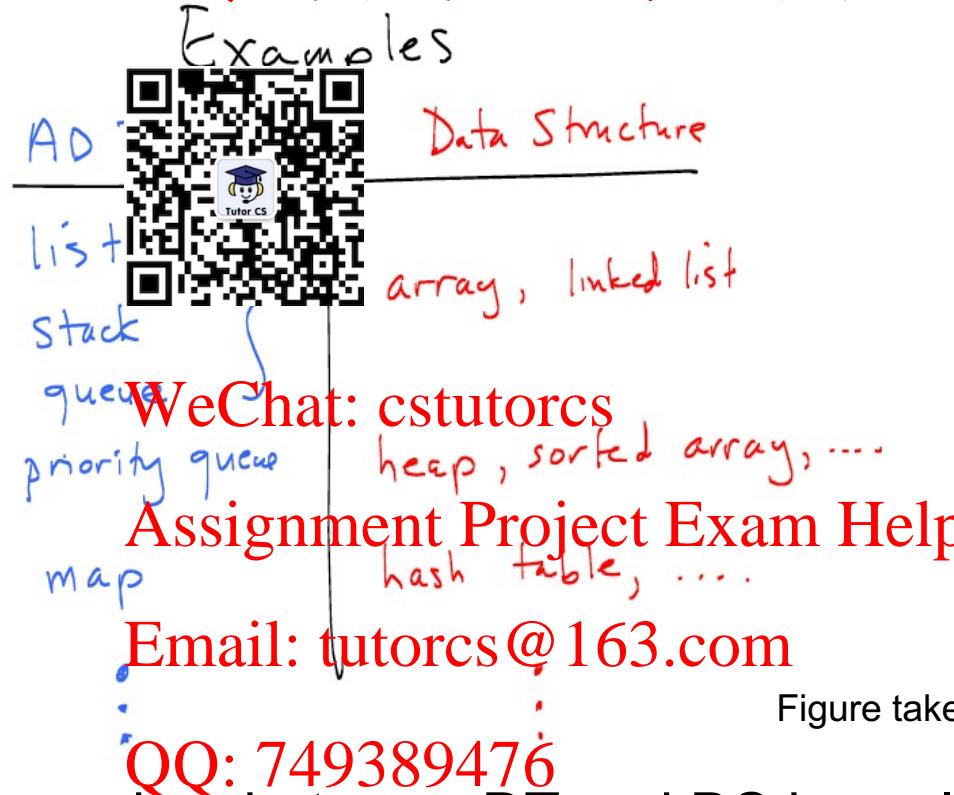

Figure taken from Comp251 - 2014

- Sometimes the boundary between DT and DS is unclear and arbitrary. In Comp251, we will use many partially implemented DS (this will not happen during the implementation) during the analysis of algorithms.
  - Enough details to discuss the complexity of the algorithm.

# Data Type VS Data Structure

程序代写代做 CS 编程辅导

Example:

ADT

list  
stack  
queue  
priority queue

map

:

array, linked list

WeChat: estutors

Email: tutorcs@163.com

QQ: 749389476

hash table, ...

<https://tutorcs.com>

structure

Linear

Non-Linear

# Data Structures Classification

程序代写代做 CS 编程辅导

- Basic data structures (built-in libraries).

- Linear DS.
- Non-Linear DS.

- Data structures (Own libraries).

- Graphs.
- Union-Find Structures.
- Segment Tree.

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

# Data Structures Classification

程序代写代做 CS 编程辅导

- Basic data structures (built-in libraries).

- Linear DS (ordering the elements sequentially).
  - Static Array (Array in C and Java).
  - Resizeable array (C++ `vector` and Java `ArrayList`).
  - Linked List: (C++ STL `<list>` and Java `LinkedList`).
  - Stack (C++ STL `<stack>` and Java `Stack`).
  - Queue (C++ STL `<queue>` and Java `Queue`).

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

# Data Structures Classification

程序代写代做 CS 编程辅导

- Basic data structures (built-in libraries).

- Non-Linear DS.

- Balanced Binary Search Tree (BBST) = C++ STL <map>/<set> and in Java TreeMap/TreeSet).

- AVL and Red-Black Trees = Balanced BST

- <map> stores (key -> data) VS <set> only stores the key

- Heap(C++ STL<queue>:priority\_queue and Java PriorityQueue).

- BST complete.

Assignment Project Exam Help

- Heap property VS BST property.

- Hash Table (Java HashMap/HashSet/HashTable).

- Non synchronized vs synchronized.

- Null vs non-nulls

QQ: 749389476

- Predictable iteration (using LinkedHashMap) vs non predictable.

# Deciding the Order of the Tasks

程序代写代做 CS编程辅导

- Returns the newest task (stack)
- Returns the oldest task
- Returns the most urgent task (priority queue)
- Returns the easiest task (queue)

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

# Stack

程序代写代做 CS编程辅导

- Last in, first out (Last In First Out)
- Stacks model piles of items (such as dinner plates)
- Supports three common operations
  - Push(x): inserts  $x$  into the stack
  - Pop(): removes the newest item
  - Top(): returns the newest item
- Very easy to implement using an array
- Useful for:
  - Processing nested formulas
  - Depth-first graph traversal
  - Data storage in recursive algorithms
  - Reverse a sequence
  - Matching brackets
  - And a lot more

WeChat: cstutorcs

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

# Queue

程序代写代做 CS编程辅导

- First in, first out (FIFO)
- Supports three common queue operations
  - Enqueue(x) : inserts item x into the queue
  - Dequeue() : removes the oldest item
  - Front() : returns the oldest item
- Implementation is similar to that of stack
- Useful for:
  - implementing buffers
  - simulating waiting lists
  - shuffling cards
  - And a lot more

WeChat: cstutorcs

Assignment Project Exam Help

QQ: 749389476

<https://tutorcs.com>

# Priority Queue

程序代写代做 CS编程辅导

- Each element in a PQ has a priority value
- Three operations:
  - Insert(x, p) : inserts x into PQ, whose priority is p
  - RemoveTop() : removes the element with the highest priority
  - Top() : returns the element with the highest priority
- All operations can be done quickly if implemented using a heap (if not use a sorted array)
- priority\_queue (C++)
- Useful for
  - Maintaining schedules / calendars
  - Simulating events
  - Breadth-first search in a graph
  - Sweep-line geometric algorithms

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

# Heap

程序代写代做 CS编程辅导

- Complete binary tree with the heap property:
  - The value of a node is greater than or equal to its children
  - What is the difference between full vs complete?
- The root node has the maximum value
  - Constant-time top() operation
- Inserting/removing a node can be done in  $O(\log n)$  time without breaking the heap property
  - May need rearrangement of some nodes

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

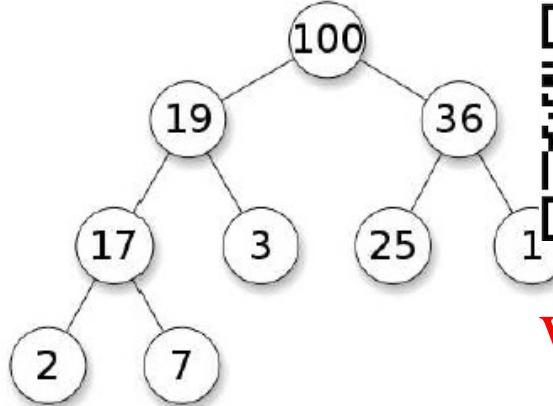

QQ: 749389476

<https://tutorcs.com>

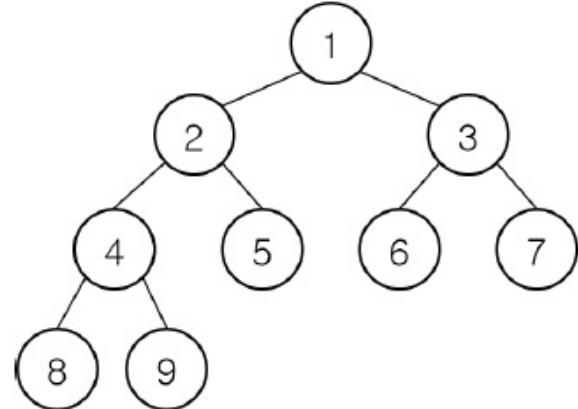

# Heap

程序代写代做 CS编程辅导

WeChat: cstutorcs

Assignment Project Exam Help

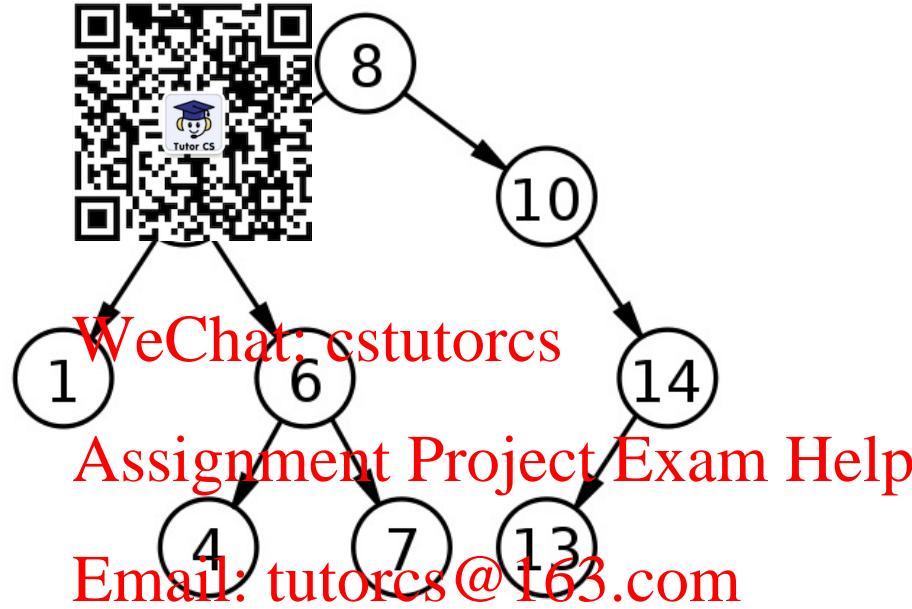

Email: tutorcs@163.com

- Start from the root, number the nodes 1, 2, . . . from left to right  
QQ: 749389476
- Given a node k easy to compute the indices of its parent and children
  - Parent node:  $\text{floor}(k/2)$
  - Children:  $2k, 2k + 1$

<https://tutorcs.com>

# BST Binary Search Tree

程序代写代做 CS 编程辅导

- The idea behind is that each node has, at most, two children
- A binary tree with the <https://tutorcs.com> property: for each node  $v$ ,
  - value of  $v \geq$  values in  $v$ 's left subtree
  - value of  $v <$  values in  $v$ 's right subtree

# BST Binary Search Tree

程序代写代做 CS编程辅导

- Supports three operations
  - Insert( $x$ ) : inserts a node with value  $x$
  - Delete( $x$ ) : deletes a node with value  $x$  , if there is any
  - Find( $x$ ) : returns the reference to a node with value  $x$  , if there is any
- Many extensions are possible
  - Count( $x$ ) : counts the number of nodes with value less than or equal to  $x$
  - GetNext( $x$ ) : returns the smallest node with value  $\geq x$
  - Curious about the extensions? Please register Comp321 next term :P

<https://tutorcs.com>

# BST Binary Search Tree

程序代写代做 CS 编程辅导

- Simple implementation cannot guarantee efficiency
  - In worst case, tree height becomes  $n$  (which makes BST useless)
- Guaranteeing  $O(\log n)$  running time per operation requires balancing of the tree (hard to implement).
  - For example AVL and Red-Black trees
  - We will skip the details of these balanced trees because we will fully cover them during the next lectures
  - What does balanced mean??
    - The heights of the two child subtrees of any node differ by at most one.

Email: tutorcs@163.com

QQ: 749389476

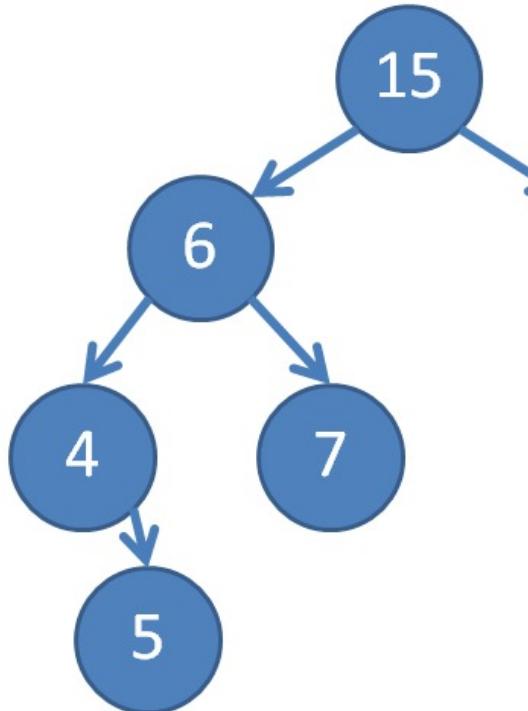

<https://tutorcs.com>

**BST**

Do you recognize the problem?

**HEAP**

# Hash Tables

程序代写代做 CS 编程辅导

- A key is used as an index to locate the associated value.
  - Content-based retrieval vs position-based retrieval.
  - Hashing is the process of generating a key value.
  - An ideal algorithm must distribute evenly the hash values => the buckets will tend to fill up evenly = fast search.
  - A hash bucket containing more than one value is known as a “collision”.
    - Open addressing => A simple rule to decide where to put a new item when the desired space is already occupied.
    - Chaining => We associate a linked list with each table location.
  - Hash tables are excellent dictionary data structures.
  - We will cover all the details about hash tables next lecture

<https://tutorcs.com>

# Data Structures

程序代写代做 CS 编程辅导

- Data structures (Own Libraries).

- Graphs.

- We will talk a lot about graphs in the last part of the course.

- Union-Find Disjoint Sets

- We will cover it a lot during the first part of the course, starting in two lectures.

- Segment tree.

- We will not cover it, but if you are curious register Comp321 next term ;)

Did you watch a movie called 'Inception'?

<https://tutorcs.com>

# Recursion - Example

程序代写代做 CS 编程辅导

$c(x)$  = total number of credits required to complete course  $x$

$c(\text{COMP462}) = ?$

= 3 credits + **credits for prerequisites**

#COMP462 has 2 prerequisites: COMP251 & MATH323

= 3 credits +  **$c(\text{COMP251}) + c(\text{MATH323})$**

*The function  $c$  calls itself twice*  
**Assignment Project Exam Help**

$c(\text{COMP251}) = ?$

$c(\text{MATH323}) = ?$

Email: [tutorcs@163.com](mailto:tutorcs@163.com)

$c(\text{COMP251}) = 3 \text{ credits} + c(\text{COMP250})$  #COMP250 is a prerequisite

QQ: 749389476

• Substitute  $c(\text{COMP251})$  into the formula:

•  $c(\text{COMP462}) = 3 \text{ credits} + c(\text{COMP250}) + c(\text{MATH323})$

•  $c(\text{COMP462}) = 6 \text{ credits} + c(\text{COMP250}) + c(\text{MATH323})$

# Recursion - Example

程序代写代做 CS 编程辅导

$c(\text{COMP462}) = 6 \text{ credits} + c(\text{COMP250}) + c(\text{MATH323})$

$c(\text{COMP250}) = ?$        $c(\text{MATH323}) = ?$

$c(\text{COMP250}) = 3 \text{ credits}$  # no prerequisite

$c(\text{COMP462}) = 6 \text{ credits} + 3 \text{ credits} + c(\text{MATH323})$   
WeChat: cstutorcs

$c(\text{MATH323}) = ?$

$c(\text{MATH323}) = 3 \text{ credits} + c(\text{MATH141})$   
Assignment Project Exam Help

$c(\text{COMP462}) = 9 \text{ credits} + 3 \text{ credits} + c(\text{MATH141})$   
Email: tutorcs@163.com

$c(\text{MATH141}) = ?$     QQ: 749389476

$c(\text{MATH141}) = 4 \text{ credits}$  # no prerequisite  
<https://tutorcs.com>

$c(\text{COMP462}) = 12 \text{ credits} + 4 \text{ credits} = 16 \text{ credits}$

# Recursion – Algorithm Structure

程序代写代做 CS 编程辅导

- Every recursive algorithm involves at least 2 cases:
  - **base case:** A simple occurrence that can be answered directly.
  - **recursive case:** A more complex occurrence of the problem that cannot be directly answered but can instead be described in terms of smaller occurrences of the same problem.
- Some recursive algorithms have more than one base or recursive case, but ~~QQ: 749389476~~ have at least one of each.
- A crucial part of ~~https://tutorcs.com~~ recursive programming is identifying these cases.

# Recursion – Algorithm Example

程序代写代做 CS 编程辅导

- **Algorithm binarySearch(array, start, stop, key)**
  - **Input:**
    - A **sorted** array
    - the region start...stop (inclusive) to be searched
    - the key to be found
  - **Output:** returns the index at which the key has been found, or returns -1 if the key is not in array[start...stop].
- **Example:** Does the following **sorted** array A contains the number 6?
  - **Email:** [tutorcs@163.com](mailto:tutorcs@163.com)
  - **QQ:** 749389476
  - **Call:** `binarySearch(A, 0, 7, 6)`

A =	1	1	3	5	6	7	9	9
-----	---	---	---	---	---	---	---	---

<https://tutorcs.com>

# Recursion – Algorithm Example

程序代写代做 CS 编程辅导

1	1	3	6	7	9	9	Search [0:7]
---	---	---	---	---	---	---	--------------

$6 < 6 \Rightarrow$  look into right half  
of the array

1	1	3	6	WeChat: 7	9	9	Search [4:7]
---	---	---	---	-----------	---	---	--------------

Assignment Project Exam Help  
 $7 > 6 \Rightarrow$  look into left half  
Email: tutorcs@163.com of the array

1	1	3	5	6	8	9	4	7	6	Search [4:4]
---	---	---	---	---	---	---	---	---	---	--------------

https://tutorcs.com

6 is found. Return 4 (index)

# Recursion – Algorithm Example

程序代写代做 CS 编程辅导

```
int bsearch(int[ ] A, int i, int j, int x) {  
    if (i<=j) { /  
        int e = (i+j)/2;  
        if (A[e] > x) {  
            return bsearch(A,i,e-1,x);  
        } else if (A[e] < x) {  
            return bsearch(A,e+1,j,x);  
        } else {  
            return e;  
        }  
    } else { return -1; } // value not found  
}
```

# What have we covered so far?

程序代写代做 CS 编程辅导

- Linear Data Structures

- Array lists, singly and linked lists, stacks, queues.

- Induction and Recursion

- Tools for analysis of algorithms.

- Recurrences.

WeChat: cstutorcs

- Asymptotic notation (big O, big Omega, big Theta)

- Basics in non-linear data structures.

- Trees, heaps, maps, Graphs.

Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

# Recursion(CS) VS Recurrence(Math)

程序代写代做 CS 编程辅导

- A **recurrence** is a function that is defined in terms of

- one or more base cases
- itself, with smaller arguments

- Examples:

$$T(n) = \begin{cases} 1 & \text{if } n=1 \\ T(n-1) + 1 & \text{if } n > 1 \end{cases}$$

WeChat: cstutorcs  
Assignment Project Exam Help

$$T(n) = \begin{cases} 1 & \text{if } n = 1 \\ T\left(\frac{n}{3}\right) + T\left(\frac{2 \cdot n}{3}\right) + n & \text{if } n > 1 \end{cases}$$

- Many technical issues:

Email: tutorcs@163.com

- Floors and ceilings
  - Exact vs. asymptotic functions
  - Boundary conditions
- QQ: 749389476
- We usually express both the recurrence and its solution using asymptotic notation.

<https://tutorcs.com>

# Algorithm Analysis

程序代写代做 CS 编程辅导

- Q: How to estimate the running time of a recursive algorithm?

- A:

1. Define a function  $T(n)$  representing the time spent by your algorithm to execute an entry of size  $n$
2. Write a recursive formula computing  $T(n)$
3. Solve the recurrence

Assignment Project Exam Help

- Notes:

Email: [tutorcs@163.com](mailto:tutorcs@163.com)

- $n$  can be anything that characterizes accurately the size of the input (e.g. size of the array, number of bits)
- We count the number of elementary operations (e.g. addition, shift) to estimate the running time.
- We often aim to compute an upper bound rather than an exact count.

QQ: 749389476

# Substitution method – Binary Search

程序代写代做 CS 编程辅导

$$T(n) = \begin{cases} 0 & \text{if } n = 1 \\ \left( \frac{n}{2} \right) + 1 & \text{if } n > 1 \end{cases}$$

WeChat: cstutorcs

Note: set the constant  $c=0$  and  $c'=1$

Assignment Project Exam Help

**Guess:**  $T(n) = \log_2 n$

**Base case:**  $T(1) = \log_2 1 = 0$

**Inductive case:** QQ: 749389476

Assume  $T(n/2) = \log_2(n/2)$

$T(n) = T(n/2) + 1 = \log_2(n/2) + 1$

$$= \log_2(n) - \log_2 2 + 1 = \log_2 n \quad \checkmark$$

Induction

Email: tutorcs@163.com hypothesis can be anything < n

# Back Substitution method – Binary Search

程序代写代做 CS编程辅导

SOLVING THE F

USING BACK SUBSTITUTION

To simply our analysis let's assume that  $n$  is a power of 2. This will not affect the order of growth of the solution.

$$T(n) = c + T(n/2)$$

$$= c + c + T(n/4)$$

$$= c + c + c + T(n/8)$$

Assignment Project Exam Help

$$= c \cdot k + T(n/2^k)$$

Email: tutorcs@163.com

=  $c \cdot \log_2 n + T(1)$ , when  $k = \log_2 n$

QQ: 749389476

which is  $\Theta(\log_2 n)$ .

<https://tutorcs.com>

# Running ‘time’ – Primitive Operations

程序代写代做 CS 编程辅导

- Simple computer operation that can be performed in time that is always the same, independent of the size of the bigger problem solved (we call it constant time)

- Assigning a value to a variable: `x = 11`
- Calling a method: `Expos.addValue()`

– Note: doesn't include the time to execute the method

- Returning from a method: `return x;`

- Arithmetic operations on primitive types

- $x + y$ ,  $r * 3.1416$ ,  $x/y$ , etc.

- Comparisons on primitive types: `x==y`

- Conditionals: `if (...) then...else...`

- Indexing into an array: `A[i]`

- Following object reference: `Expos losses`

QQ: 749389476

- **Note:** Multiplying two Large Integers is *not* a primitive operation, because the running time depends on the size of the numbers multiplied.

$$\begin{aligned} & T_{\text{cond}} + T_{\text{comp}} \\ & T_{\text{arith}} + T_{\text{assign}} \\ & T_{\text{cond}} + T_{\text{comp}} + T_{\text{index}} \\ & T_{\text{return}} + T_{\text{call}} \\ & T_{\text{cond}} + T_{\text{comp}} + T_{\text{index}} \\ & T_{\text{return}} + T_{\text{call}} \\ & \text{cond} \end{aligned}$$

repeated  $\log(|A|)$   
times in the worst  
case scenario

# Running ‘time’ – Primitive Operations

程序代写代做 CS 编程辅导

- Counting each type of primitive operations is tedious
- The running time of an operation is roughly comparable:  
 $T_{\text{assign}} \approx T_{\text{comp}} \approx T_{\text{arith}} \approx$   = 1 primitive operation
- We are only interested in the **number** of primitive operations performed
- Worst-case running time for binary search becomes:

Email: [tutorcs@163.com](mailto:tutorcs@163.com)  
QQ: [749389476](https://tutorcs.com)  
$$T(n) = \begin{cases} c & \text{if } n \leq 1 \\ T\left(\frac{n}{2}\right) + c' & \text{if } n > 1 \end{cases}$$
<https://tutorcs.com>

- When  $n$  is large,  $T(n)$  grows approximately like  $\log(n)$ . Then, we will write  $T(n)$  is  $O(\log(n)) \Rightarrow T(n)$  is big O of  $\log(n)$

# Towards a formal definition of big O

程序代写代做 CS 编程辅导

- Let  $t(n)$  be a function that describes the time it takes for some algorithm on input size  $n$ .

- We would like to express how  $t(n)$  grows with  $n$ , as  $n$  becomes large i.e. **asymptotic behavior**.

WeChat: cstutorcs

Assignment Project Exam Help

- Unlike with limits, we want to say that  $t(n)$  grows like certain simpler functions such as  $\Theta(n), \Theta(\log_2 n), \Theta(n^2), \Theta(n^3), \Theta(2^n) \dots$

QQ: 749389476

<https://tutorcs.com>

# Towards a formal definition of big O

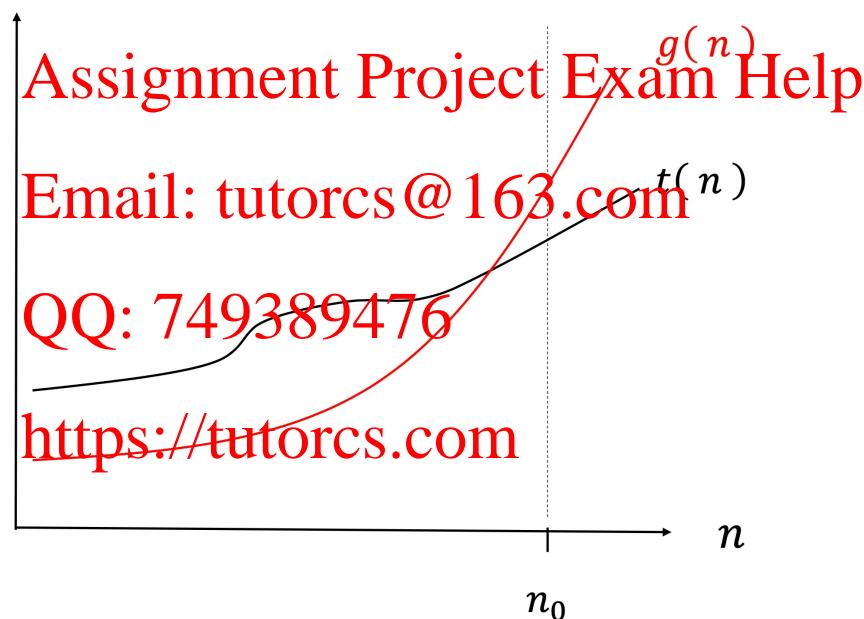

程序代写代做 CS 编程辅导

- Let  $t(n)$  and  $g(n)$  be two functions, where  $n \geq 0$ . We say  $t(n)$  is *asymptotically bounded above by  $g(n)$*  if there exists  $n_0$  such that, for all  $n \geq n_0$ ,

$$t(n) \leq g(n)$$

WeChat: cstutorcs

# Towards a formal definition of big O

程序代写代做 CS 编程辅导

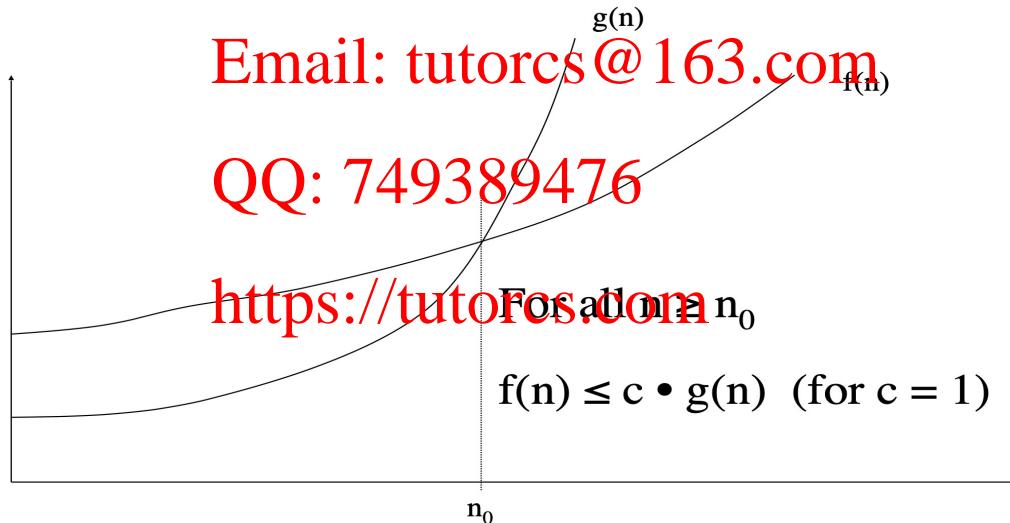

- Let  $t(n)$  and  $g(n)$  be two functions, where  $n \geq 0$ .  
We say  $t(n)$  is  $O(g(n))$  if there exists two positive constants  $n_0$  and  $c$  such that, for all  $n > n_0$ ,  
$$t(n) \leq c \cdot g(n)$$

## Intuition

WeChat: cstutorcs

- “ $f(n)$  is  $O(g(n))$ ” if and only if there exists a point  $n_0$  beyond which  $f(n)$  is less than some fixed constant times  $g(n)$ .

Assignment Project Exam Help

# Towards a formal definition of big O

程序代写代做 CS 编程辅导

- Tips.

- Never write  $O(3n)$ ,  $O(5n)$ , etc.
  - Instead, write  $O(n)$ , etc.
  - **Why?** The point of the notation is to avoid dealing with constant factors. It's technically correct but we don't do it...
- $n_0$  and  $c$  are not *uniquely* defined. For a given  $n_0$  and  $c$  that satisfies  $O()$ , we can increase one or both to again satisfy the definition. **There is not “better” choice of constants.**
  - **However**, we generally want a “tight” upper bound (asymptotically), so functions in the big O gives us more information (Note: This is not the same as smaller  $n_0$  or  $c$ ). For instance,  $f(n)$  that is  $O(n)$  is also  $O(n^2)$  and  $O(2^n)$ . But  $O(n)$  is more informative.

$f(n) = O(g(n))$	is like	$a \leq b$ ,
$f(n) = \Omega(g(n))$	is like	$a \geq b$ ,
$f(n) = \Theta(g(n))$	is like	$a = b$ ,
$f(n) = o(g(n))$	is like	$a < b$ ,
$f(n) = \omega(g(n))$	is like	$a > b$ .

# Towards a formal definition of big $\Omega$

程序代写代做 CS 编程辅导

- Let  $t(n)$  and  $g(n)$  be two functions with  $n \geq 0$ .

- We say  $t(n)$  is  $\Omega(g(n))$  if there exists two positive constants  $n_0$  and  $c$  such that, for all  $n \geq n_0$ ,

WeChat: cstutorcs

- $t(n) \geq c \cdot g(n)$

Assignment Project Exam Help

Email: tutorcs@163.com

- Note: This is the opposite of the big O notation. The function  $g$  is now used as a "lower bound".

QQ: 749389476

<https://tutorcs.com>

# Towards a formal definition of big Theta

程序代写代做 CS 编程辅导

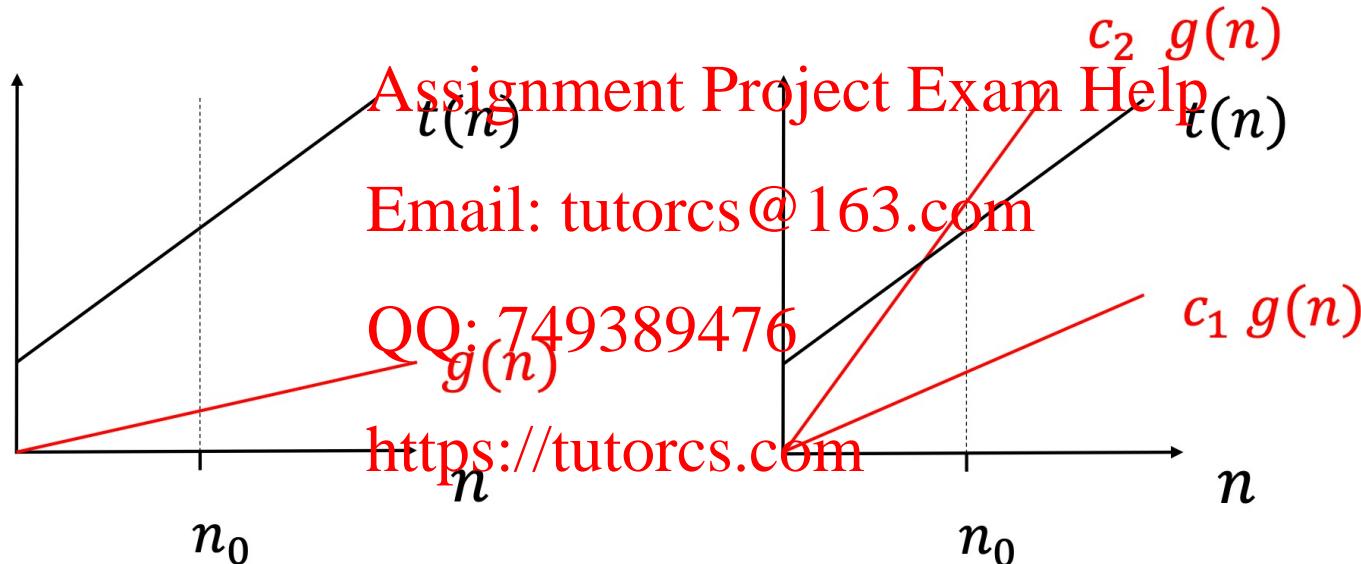

- Let  $t(n)$  and  $g(n)$  be two functions, where  $n \geq 0$ .

We say  $t(n)$  is  $\Theta(g(n))$  exists three positive constants  $n_0$  and  $c_1, c_2$  such that, for all

$$c_1 \cdot g(n) \leq t(n) \leq c_2 \cdot g(n)$$

WeChat: cstutorcs

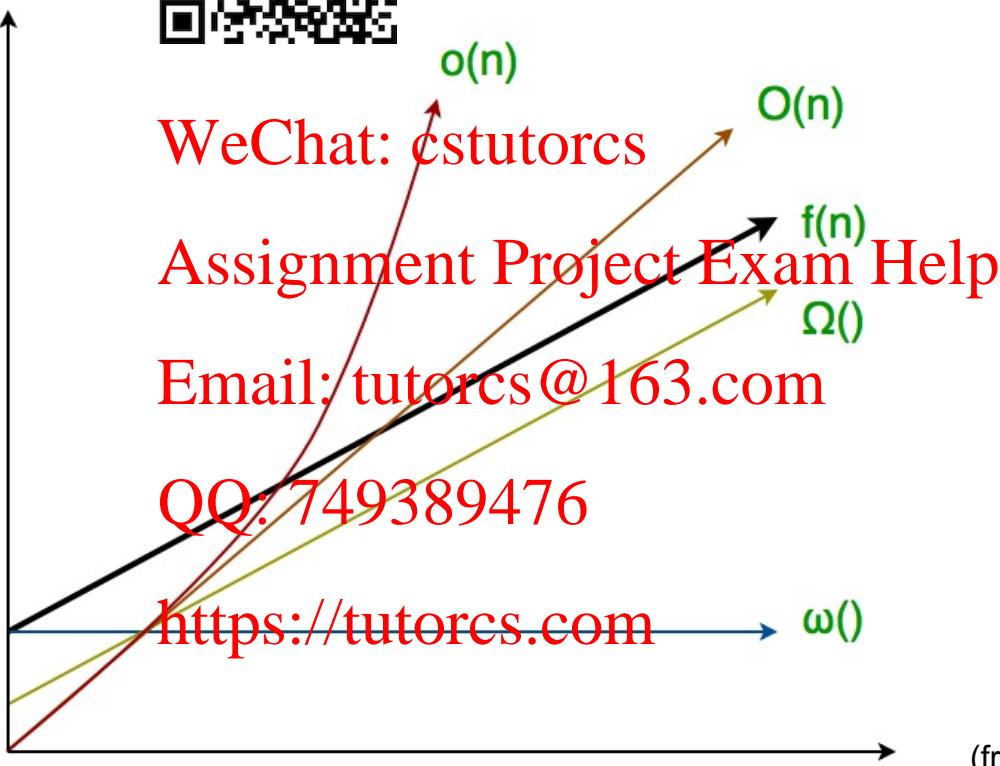

**Note:** if  $t(n)$  is  $\Theta(g(n))$ . Then, it is also  $O(g(n))$  and  $\Omega(g(n))$ .

# Big VS little

程序代写代做 CS编程辅导

- The big O (resp. big  $\Omega$ ) denotes a tight upper (resp. lower) bounds, while the big  $\Theta$  (resp. little  $\omega$ ) denotes a lose upper (resp. lower) bound
